A twostroke engine is an internal combustion engine that completes the process cycle in one revolution of the crankshaft (an up stroke and a down stroke of the piston, compared to twice that number for a four-stroke engine). Four-Stroke Engine In a four-stroke engine (called a four-cycle engine), four strokes are needed to complete the operating cycle. The four strokes are as follows: • intake stroke • compression stroke • power stroke • exhaust stroke Two strokes occur during each revolution of the crankshaft. Therefore, a four-stroke cycle requires. two stroke cycle engine (petrol engine) In two stroke cycle engines, the whole sequence of events i.e., suction, compression, power and exhaust are completed in two strokes of the piston i.e. one. The document explains that a 2-stroke engine completes its cycle in two strokes while a 4-stroke engine takes four strokes. It provides details on the intake, compression, ignition, and exhaust stages in each type of engine. two stroke cycle engine (petrol engine) In two stroke cycle engines, the whole sequence of events i.e., suction, compression, power and exhaust are completed in two strokes of the piston i.e. one.
