Onyx stone is, but nonetheless, hardly ever used in kitchens and baths since it is difficult to install and requires constant upkeep to keep its beautiful appearance. Due to its distinctiveness, which enables the material to shine apart from conventional designs, it is most commonly chosen to build bar tops. Onyx can be used as a splashback, surrounding bathroom mirrors, tubs, or in claddings that are illuminated or glow from beneath. Although this is probably not realistic for regular use in kitchen workstations, it can give the impression that the stone is luminescent when it is implemented in these settings.
