

Pain and injury is a very common problem in the world. People want to get rid of it. Generic medicine like **Soma** also known as **Carisoprodol** works very well in pain and injury.

**Carisoprodol**, a prodrug associated with meprobamate, maybe a centrally acting relaxant of carbamate class, treat problems associated with striated muscle like **pain or injury**.

**Carisoprodol**, a central system a nervous depressant, acts as a sedative and striated muscle relaxant. The drug interrupts neuronal communication within the reticular formation and spinal cord and thus helps in sedation and alters the pain perception, instead of acting directly on skeletal muscle.

**Soma** is marketed as tablets of **250mg** and **350mg**. Medication involves oral ingestion thrice daily and at bedtime up to 2 to three weeks. This drug is recommended for a short term used as the evidence of effectiveness is inadequate for prolonged use and painful musculoskeletal conditions are usually of a short time.

Before using the medicine, a physician should be informed regarding the taking of other drugs that cause drowsiness such as opioid pain and cough relievers, antihistamines, alcohol, other drugs for sleep or anxiety or other muscle relaxants.

**Side effects of Carisoprodol** include drowsiness, headache, dizziness, allergic reactions, trouble breathing, confusion, and others.

Information given here is predicated on the salt content of the drugs. Uses and effects of the drugs may vary from person to person.

### **Key Highlights of Carisoprodol**

Q. Is it safe with alcohol?

Ans. Soma 350mg tablet may cause excessive drowsiness and calmness with alcohol.
