

You Can Now Keep Your Diamonds Sparkling For Long

Whether you have the [best custom engagement rings](#) or a very simple piece of diamond jewelry, it is obvious that you want your diamonds sparkling for a long. Diamonds reflect and refract light which causes them to sparkle and shine so much. The facets of diamonds are of utmost importance when it comes to determining their sparkle.

Dirt and dust often spoil the look and feel of your diamonds. Here are a few ways you can keep your diamond sparkling for long:

- **Use mild cleaning agents like a gentle degreasing solution**

Diamonds are very sensitive to oil and dust. Even the oil from your fingertips can cause diamonds to look dull. You can make a mild degreasing solution at home.

All you have to do is mix a few drops of mild soap with a little water. Soak your jewelry in the solution for a while and then wipe it with a gentle toothbrush.

- **Be Very Gentle With Your Diamond Jewelry**

If you are using a toothbrush to clean your jewelry, you must ensure that the bristles of the toothbrush are very soft and gentle. Also, make sure you use a gentle toothbrush with a very light hand too.

If the jewelry is very fragile, please avoid the toothbrush. You can use a lint-free cloth to wipe your jewelry well after you rinse it with normal water.

- **Make Sure You Do Not Use Any Abrasives**

Harsh abrasives are very dangerous for your diamond jewelry. Abrasives like household cleaners, bleaches, chlorine cleaners, toothpaste, etc. must be kept far away from your

jewelry. The harsh chemicals in the abrasives damage the precious metals and scratch their surface. This results in the deterioration of the look and feel of your jewelry.

- **Ultrasonic Cleaners Are Not A Good Option Always**

[Jewelers in Hawaii](#) are very careful when it comes to using ultrasonic cleaners. These cleaners send low-frequency sound waves through a solution. The vibrations help displace the encrusted dirt. However, in case the mountings are loose and diamonds are placed close to each other, the jewelry might get damaged. The girdles of the diamonds might also get chipped as they get rubbed against each other.

Ultrasonic cleaning is not fit for all jewelry. Ask your jeweler for the best advice. If your jewelry has been treated before, ultrasonic cleaning might not be a good option for you. You can also check your diamond grading report to get all relevant information.
