

Tranquilizers or anti-anxiety drugs relieve psychological and emotional stress and fear

Tranquilizers belong to the different classes of chemical compounds. One of these classes is benzodiazepine derivatives. Different tranquilizers are used for the treatment of different diseases.

Therefore, they're used not only for the treatment of psychological and neurological diseases, but also for the therapy of different internal disorders. However, these drugs can be used only under the medical supervision, as their wrong use may cause different side effects.

Xanax alprazolam belongs to the group of tranquilizers with anti-depressive properties. It relieves anxiety, relaxes the muscles and has anti-seizure and moderate sedative effect. It is used for the treatment of neuroses, psychopathy, accompanied by the sense of fear and anxiety; reactive depressive states caused by the internal diseases; panic attacks and pathological fear.

Xanax may cause the lack of concentration, slow psychological and motor responses, vertigo and insomnia. The rare side effects of cheap Xanax include vision impairment, headache, sleeping disorder, depression, nervousness, anxiety, tremor, change in the body weight, memory impairment, autonomic dysfunctions, lack of coordination and digestive problems. Some patients may [buy Xanax](#) online and experience anxiety, irritability, mental confusion, hallucinations and muscle fatigue. The long-term treatment with generic Xanax may cause autonomic dysfunctions, reduced libido, urination frequency or retention and kidney dysfunction.
