

CNC Machining Van Nuys CA

We've been serving California businesses for over 40 years. From the design and manufacture of your prototype to the mass production, quality-assurance inspection, and delivery of your goods, we can assist you with any phase of your metal construction project. In addition to standard metal fabrication services like shearing, spot welding, welding, grinding, rolling, and hardware installation, we offer a number of computer numerical control (CNC) services, including laser cutting, milling, turning, punching, forming and bending. Because these processes are automated by programmed codes, products created using these methods can adhere to highly precise specifications. In order to better serve you, we have also developed a network of business relationships that enables us to provide customers with end services, including powder coating, wet painting, silk screening, and plating. These services give us the ability to be your one stop shop for all your metal fabrication needs.
