

# Natural Flea Therapy For Canines Is Best

The [best flea treatment](#) starts, not in searching for the very potent yet natural flea killer. This only seeks to address the consequence of the issue. As an alternative, the ideal way to solve any challenge is to hunt for the origin. No vet understands the reason behind disease, not to mention the cause of fleas. They have yet to be trained to search for causes as this makes no marketing sense. Once you love that vet schools are largely funded by corporations that have a vested interest in the end, then your vision starts to clear!

Of course, you'll find lots of amazing vets that do go out of their way to plumb the depths of this reason behind ailments and disease generally. But sadly, these are in the minority.

Instead, similar to the rest of the world, profit is at the origin of the organization financing of veterinarian schools. But it's done in a clever way, so as to convince the vast majority of the students.

When the reason behind whatever is addressed, then the issue is solved. No profit may be made from such insane tactics! So, you're kept in blissful ignorance, ponying up for ever more toxic and dangerous (to not express, costly ) treatments. However, usually the one who really suffers can be the pet.

Fleas are most common in any animal with fur. There's a very good explanation for this. The skin is the first (and preferred) organ of the human anatomy by that to expel unwanted or toxins chemicals. Yes, the kidneys play an important role in this too, but the skin takes up the slack.

Fleas scavenge those chemicals. They feed them. Any insect that participates on your skin does exactly the same thing. They are doing their server a wonderful support. It's just the same as birds that pick off pollutants from grazing wildlife.

This means, some fleas are natural and normal. What's not normal and natural is that a flea outbreak or your dog's hyper-reaction into them. These would be the issues. So that the flea treatment has to start with the explanation for why such occur.

Toxins are a lot more plentiful in the world than they are in character. By the very nature of living around, your pet's immunity system, the device that functions to rid the pet of damaging toxins, is under pressure. Household cleaning compounds, chemical treatments from your house, garden rugs, and so on, all take their toll in your dog.

However, possibly the two most damaging impacts in your dog's toxin load are commercial dog food and veterinary medication.

Commercial pet food, at the absolute best, consists of low quality beef, high carbohydrate articles, preservatives (that would never be allowed in human food because of their highly toxic nature), synthetic "nutrients" (to try and compensate for the brief autumn ), colours, tastes and appetite stimulators.

That usually means that every single day, you're loading up your dog with increasing amounts of toxins. To test to balance this, your pet's immune system attempts to get rid of the toxins faster. The skin comes in to playwith. Eruptions or simply itchy, both reveal what's happening. But this attracts more fleas. A lot more than ordinary since the toxin dump is a lot more than usual.

Thus that the dogs scratch. Along with scratch. Along with scrape. Driving us up the wall!

The veterinary remedy is not to reduce the poison load your poor dog is taking. Rather it is hellbent on increasing the poison load.

Today your dog's immune system struggles to retain the status quo. Some healthier dogs manage to hold longer than others, but earlier or later, other, more crucial organs have been changed. Kidney disease, diabetes, liver malfunction, heart issues are inevitable when your pet's immunity system is not allowed to work economically.
