While house hunting, there are a number of things that you wish to check out before putting in your final offer. One of those major needs is a pharmacy within walking distance. You never when you might need the help of first aid or your essential medicines, but with a pharmacy like

Health 29, the best pharmacy in Gurgaon, and also [an online pharmacy store](#), right there for you, you have got yourself totally covered!

What is a Pharmacy?

Pharmacy is the clinical health science that connects medical science with chemistry and it is responsible for the discovery, production, disposal, safe and effective use, and regulation of prescriptions and drugs.

What are the different types of Pharmacies?

Some of the different types of pharmacies are :

Community Pharmacy

The community pharmacy, often known as a retail pharmacy, is the most well-known type of pharmacy. This is the type that is most commonly referred to as a pharmacy or chemist shop. A community pharmacist typically works in a store that offers residents access to the prescriptions they require, as well as guidance on how to take the medications safely and effectively. They can warn their customers whether drugs mix with each other or with alcohol, and they can assist them to avoid potentially harmful or bothersome prescription combinations or side effects. Part of their responsibilities includes assisting patients with drug reimbursement, overseeing pharmacy techs, and maintaining drug inventory.

Clinical Pharmacy

Clinical pharmacies can be found in a variety of places, including hospitals, nursing homes, and other medical facilities. A clinical pharmacy's goal is to ensure that patients get the most out of their drugs by providing drug information and monitoring drug safety and efficacy. They can forecast drug interactions and so avoid numerous prescription side effects.

Hospital Pharmacy

A hospital pharmacy is a place where pharmaceuticals are managed at a hospital, medical clinic, or nursing home. A hospital pharmacist frequently collaborates with other health experts to ensure that each patient's pharmaceutical regimen is optimized for the greatest results. Clinical trials, compounding pharmaceuticals for personalised dose, and sterile medications are all possibilities. Teaching, administrative functions in the selection, correct storage, distribution, and prescription procedures of pharmaceuticals, medical staff education in the areas of drug selection, administration, and monitoring, as well as analysing drug levels and drug safety, may all be part of their job. Inpatient and outpatient pharmacists work in hospitals, and they may specialise in one or more areas of pharmacotherapy.

Consulting Pharmacy

Consulting pharmacy is a very new branch of pharmacy, having only been established in 1990. Rather than delivering prescriptions, it focuses on a theoretical evaluation of medications. Consultant pharmacists frequently work in nursing homes or visit patients in their homes to help them get the most out of their drugs.

Regulatory Pharmacy

Regulatory pharmacy, sometimes known as government pharmacy, is in charge of developing rules and regulations for the safe use of medicine in order to promote beneficial health outcomes. Pharmacists in public health and regulatory health boards, such as the Food and Drug Administration in the United States, fall under this category.

Home Care Pharmacy

The preparation and distribution of injectables to severely sick patients in the home is the main focus of the home care pharmacy. This is also known as an infusion pharmacy because only injectable pharmaceuticals are delivered, rather than medications that are taken orally or topically. They may specialize in one or more areas of medicine, such as nutritional infusions, chemotherapy, mental disease, or oncology.

Compounding Pharmacy

A compounding pharmacy is a facility that creates and prepares medicines in new forms. Reformulating a powder tablet into a solution, for example, can help in drug administration for certain patients.

Depending on the purpose of their formulation, a compounding pharmacist may work in a community, clinical, or residential context. In rare cases, they may also deliver ready-made drugs.

The evolution of Pharmacy Stores: Online Pharmacy Stores!
