

A hand wearing a blue nitrile glove holds a red-tipped test tube labeled "Renal Function Test". The test tube is positioned over a medical form that lists various blood tests. The form includes checkboxes for "BUN", "Creatinine", "Uric acid", "Lipid Profile", "Total Cholesterol", and "Triglyceride". The "BUN" and "Creatinine" checkboxes are marked with red checkmarks, indicating they are part of the renal function test panel.

A **kidney function test** is a simple test done with blood and urine samples. KFT helps in identifying the problems and diseases of kidneys. The kidney function test includes creatinine clearance, blood urea nitrogen, and serum creatinine. It also helps to detect urine protein.
