

The Best Business Card Scanner Is Now Available

This is where you will start your quest for finding the [best business card app](#). There are so many options out there that it is hard to know where to begin. I have listed a few things to look for and consider when choosing the best business card app:

Scanning speed - The best business card app should have a high scanning speed. This will make it easy to scan multiple cards quickly. Depending on your budget, this could be your best business card app in terms of bulk scanning. You could capture as many cards as you like within minutes of setting up the free plan! You don't have to organize the cards on a sheet for the scan results to be truly accurate though.

Types of files - Not all business cards are printed on photo papers. Many companies print their digital business cards only. If your app includes digital business cards, then you will want a good program that can handle both types. Some types of files are easier to scan into the program while others tend to hold on to more dust. You don't want your scans to become outdated quickly. Check your options for a scanned image of your business cards.

Scanner - scanning is great but you want a scanner that is quick and accurate. It's best to find a good scanner for your phone or tablet. Some apps will allow you to use a specific type of scanner for a specific brand of card. For example, if you have a Blackberry, you may want to make sure your scanning program can scan Blackberries.

Contacts - the best business card scanner app will have a way to import your contacts. Contacts are an important part of your business. Without contacts, you will be unable to do most transactions. Find an app that has a way to import your contact list. If you can't import contacts from your desktop or laptop, then this is not the best business card app.

Printing - the printing part of your app is vital. Some business card apps include a printing function. If yours does not have a built in printing option, then find an app that does. You'll want a printer that prints your cards on both sides with the right quality and colors. The printing process should be able to accommodate all of the dimensions of your card. Check your options for both paper sizes as well as the quality of the paper.
