Hello everyone !

I present you today a small tutorial on the parsing, it is a process which will allow you to obtain dorks which will be better quality than what you could find on the web.

You will need an alwaysdata (its FREE)

In this tutorial we are gonna use the parsing.
Parsing is a process aimed at working the text, delineating in each line the characters that will be kept / removed.

So the parser is a PHP script, which will allow you to parse the injectable links found in **SQLi Dumper.**

Before :

http://awebsite/index.php?type=999999.9' union all select 1,[t],3,4,5,6,7,8,9,10 and '0'='0 **After :** index.php?type=

THE PARSER :

```
<?php $lines = file('dork.txt'); foreach ($lines as $lineNumber => $lineConte
nt) { $arr = parse_u rl($lineContent); $lol = explode("[t]",substr($arr["pat
h"],1)."?".$arr["query"]); $lol2 = explode('=',$lol[0]); echo $lol2
[0]."="."\n"; } ?>
```

Save it as script.php, and upload it to your alwaysdata (in the www folder of course) Create the dork.txt file with the list of your injectable sites that you want to parse.

Both files have to be in the same folder.

Like this : https://prnt.sc/be9ryn

Once this is done, go to yourname.alwaysdata.net/yourfolder/script.php to view the dorks, CTRL + U for the source code for better visibility.

INFORMATIONS : 1.Check the encoding of your files (otherwise error? =) Go all in UTF8 2.Verify the permissions in FileZilla -> Right click on the file, Permission with code 777.

For any issues, PM me or check my discord : https://discord.gg/GTgTY

Thanks for reading !
