

What Exactly is Chemical Pregnancy?

A chemical pregnancy, also known as a biochemical pregnancy, is a loss of a pregnancy that occurs within five weeks after implantation. Many women who experience a chemical pregnancy are unaware that they have conceived since the only indicator is late menstruation. During a chemical pregnancy, the body generates enough hCG (human chorionic gonadotropin) to provide a positive pregnancy test at first. However, at this early stage, an ultrasound scan cannot identify the pregnancy, implantation will eventually fail and serum hCG levels will decline.

To know more about chemical pregnancy consult Dr. Deepika Doshi the top [Gynecologist in Dahisar](#).
