

## **Fildena 50 mg is a cheaper version of Viagra purple and is claimed to work with the same efficacy and ability.**

The manifestation of Fildena 150 can be proven by an increase in the blood flow towards the penis which ensures that the person consuming it experiences harder and firmer erections. The drug is available in different strengths and the customers can choose any of them according to his disease. It is an orally active medicine which is said to be associated with a number of side effects which are generally linked to the presence of sildenafil in it. Since it is an inexpensive drug, the majority of the people suffering from erectile dysfunction are able to afford it for a long time which marks for the popularity of this drug.

Fildena 150 consists of sildenafil citrate in its composition which belongs to the class of agents that work by inhibiting the pharmacological action of phosphodiesterase type 5 enzyme. Phosphodiesterase type 5 is an enzyme which is normally present in the penis as well as the prostate gland in males. In these glands, the enzyme is responsible for degrading a substance known as cyclic Guanosine Monophosphate ( <http://mydiscountpills.eu/> ) which is produced by the virtue of nitric oxide in the penis of a person upon sexual stimulation. When administered into the body, Fildena 100 mg acts to improve the effects of nitric oxide by blocking the action of PDE5 and producing relaxation among the penile muscles. It must be kept in mind that the sildenafil citrate does not have any direct relaxing effect on the penis but sets in action a chain of events which produce relaxation in the corpus cavernosum by collaborating with each other. When a person who has taken sildenafil citrate gets sexually stimulated, nitric oxide is produced in the penile tissue which together with an increased level of cGMP (due to Fildena 150) causes relaxation in the muscles and vasodilation in the arteries leading towards the penis resulting in an erection.

Fildena is in sublingual form that has to be consumed orally without water or high fat meals. Take one sublingual tablet once in a day by placing it below tongue. The tablet dissolves in mouth and gets mixed in blood stream. This action mechanism is quick and leads to erection if stimulation is present while consuming medicine. Take ED medicine 30 minutes before intercourse in presence of complete sexual stimulation. Effectiveness of medicine lasts for approx. 4 to 6 hours: <http://www.comfortcareco.com/fildena-50.html>

Fildena 50 being a sildenafil containing drug is widely prescribed worldwide for the treatment of erectile dysfunction. According to an estimated study, it has been shown that 30 million men spread across 120 different countries across the globe are prescribed with sildenafil loaded drugs and about ten thousand people use these drugs every day after getting a prescription from the doctor. On the other hand, alcohol is an equally famous and renowned beverage and is widely sold in different countries in an amount so high that it has been estimated that an average person residing in the United Kingdom consumes alcohol in a quantity of 15 and a half liters every year. Since alcohol consumption has become so common among the people, it might be important that how sildenafil containing drugs like Fildena 100 mg behave in the presence of alcohol: <https://purpleviagra.mobi/fildena-100.html>

It can be concluded that like with many other medicines, taking alcohol along with Fildena 25 mg or any other sildenafil containing drugs meant to relieve erectile dysfunction can result in a decreased efficacy of it. However, the use of alcohol prior to taking Fildena 100 might result in less risk for developing any complexity. Nevertheless, people using Filagra must be careful about their lifestyle choices because using it with alcohol not only reduces the effectiveness of the drug but also causes a worsening of the symptoms that are usually associated with the intake of Fildena 50. Most importantly, it also makes the person dependent on Fildena for a longer period of time which is medically not advised.
