

WHY SHOULD YOUR COMPANY INVEST IN PENETRATION TESTING?

Penetration testing involves an ethical hacker identifying the vulnerabilities in an organisation's systems or applications for cybersecurity purposes.

The goal is to find the weaknesses and come up with solutions to fix them before a malicious attacker compromises the given system.

For those organisations that need to prove compliance with PCI DSS or ISO 27001, penetration testing is a standard testing approach.

70%

of organisations leverage these assessments to test the effectiveness of their security controls.
