

What is PHP Website Development Services and PHP Framework for Web Development

In simple words, [PHP website development](#) is a server-side scripting language used by companies to best develop basic, stable, and dynamic websites for their business. PHP stands for website development hypertext preprocessor that was previously recognized as a personal home page. This platform is very fast, secure, and reliable which provides countless benefits to companies adopting the PHP framework for website development. You can have dedicated PHP programmers to make your website dynamic in this high-tech market. Some of the key benefits of offering PHP website development are as follows:

- **PHP framework** supports like Oracle, MySQL, Sybase, etc.
- It is very consistent with servers like IIS, Apache, etc.
- It runs on several platforms that include Windows, Linux, etc.
- You can easily create a website with its easy functions, methods, and syntax
- It supports database management systems
- It can also integrate with open source software such as Joomla, Drupal, etc.

PHP (Hypertext Preprocessor) is considered one of the most popular scripting languages, designed specifically for web development. It is an interpreted language and simply requires a

web browser to run on the client system. [PHP website development](#) is one of the most commonly used programming languages for developing static and dynamic websites as well as web applications. PHP website development includes server-side scripting, command-line scripting, and desktop application development. The following are the reasons why PHP is so popular:

- 1) Object-Oriented
- 2) Free & Open Source
- 3) Easy to Learn
- 4) Easy to Use
- 5) Reduced Complexity
- 6) Secure

In addition, there are many popular frameworks based on PHP, which have made the process of website development easier, including **Laravel, CodeIgniter, Symfony, Zend, Falcon, CakePHP**. The most well-known websites, such as **Facebook, Wikipedia, Flickr, Yahoo**, etc., have also been developed using PHP. Apart from this, **CMS** like **WordPress, Joomla, Drupal**, etc. are also based on PHP.
