

## What is 3D CAD Modeling?

We deliver top quality 3D CAD Modeling services to our global clientele based out of the USA, UK, Canada, Australia, Europe, Singapore, Norway, Ireland UAE region.

We know each object has three dimensions: Length, width, and depth. It means you can see an object from six different perspectives: front, back, right, left, upper, and lower.

When you draw a shape on a sheet of paper it usually involves two dimensions: Length & width. If you wish to see all dimensions and perspectives, You will have no way to see it in any 2D CAD drawing, and here is the scope of 3D CAD modeling to function.

Like a real object, our virtual [3D CAD model](#) has all properties including, material, weight, size, shape, depth, and a variety of other optical and physical properties.
