

# Evidences for efficiency of CakePHP Development

The web application framework is the system that can be reused many times by the developers for the development of web applications and websites. Frameworks are reusable designs that may consist of various supportive programs, code libraries, and a scripting language. It's a fantastic idea for developers to use re-usability in web development to increase productivity.

**CakePHP Development**, one of the most popular web application frameworks developed in the PHP programming language, is one of the many beneficial frameworks that have been bestowed by open source and are showing their superiority in web development. It was first presented to the web world in 2005, shortly after the Ruby on Rails concept, and has since been widely distributed under the MIT license.

Using frameworks written in any language helps the developers to concentrate more deeply on the core business requirements rather than spending precious time on other technical issues in the website and application development. CakePHP framework is one of the most popular open-source frameworks because of its many technological features, including:

- It helps the developers to make an interface with the database and active records
- CakePHP development follows the architectural pattern of model-view-controller
- It has great compatibility properties with other programming languages such as PHP4 and PHP5

- Feature of Built-in validation
- Feature of data sanitization
- Feature of Application Scaffolding
- Router for mapping URLs and handling extensions
- Security, Session, and Request Handler Components
- Utility classes for working with Files, Folders, Arrays, and more
- Helpers for HTML, Forms, Pagination, AJAX, JavaScript, XML, RSS and more

Frameworks are the ideal approach for saving time and decreasing project complexity while developing huge complicated systems. It aids in enhancing programmers' productivity because frameworks limit programmers' options throughout development.

**CakePHP development framework** has all of the functionality needed to create dynamic web apps and websites that meet the majority of the online public's expectations. According to experienced developers in open source technologies, CakePHP development is a cost-effective method of developing web applications.

Most of the CakePHP development users evidently say about cheap & quick development of web applications and websites. Still one should consult a professional for the correct advice before taking any decision. **ISyncEvolution** is ready to help you in any situation
