

What is Angular?

Angular is described as a one-stop solution for front-end development. Learn about Angular, including Angular Framework, and its benefits.

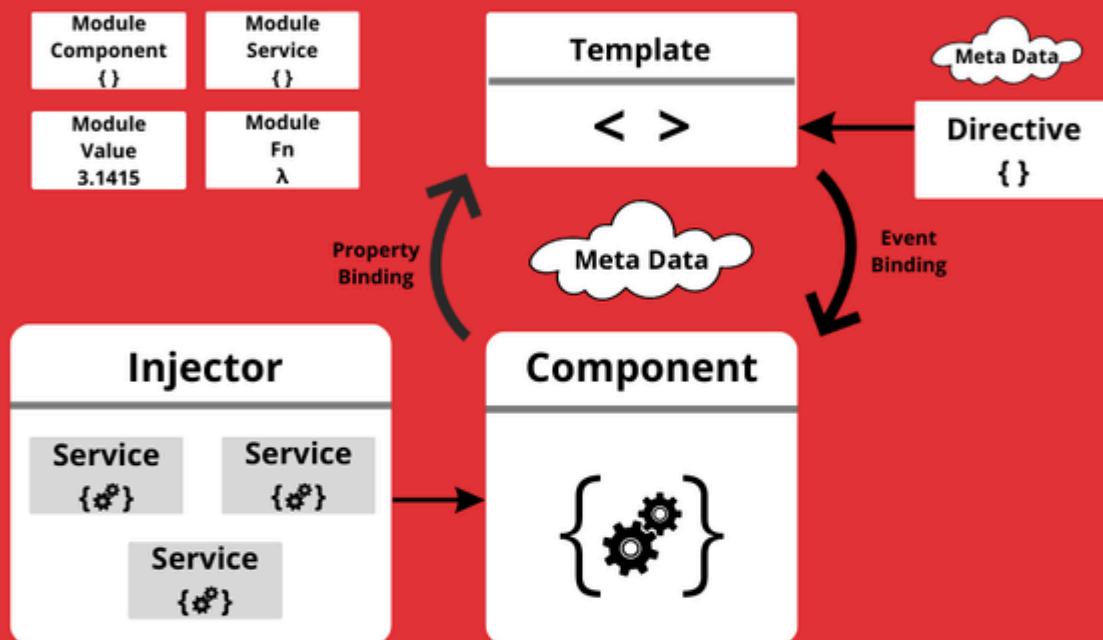

WHAT IS ANGULAR?

Angular is a platform and framework that is specifically made for creating web and single-page apps. For creating reliable online apps, Angular tightly adheres to the HTML template language and is written in the TypeScript programming language.

Core and optional functionality are implemented by Angular exclusively as a collection of TypeScript libraries that you import into your apps. When creating apps, developers working with an AngularJS development business must adhere to and follow certain guidelines set forth by Angular.

Angular Architecture

As discussed, Angular is a framework for building web applications using HTML and JavaScript. Also, it uses a TypeScript language that makes it easy for the developers to compile it to JavaScript.

The framework consists of several libraries, some the core and some optional. From the above diagram, we can see that the Angular framework is divided into 8 main blocks which are as under:

- Modules, Components, Templates, Metadata, Data Binding, Directives, Services, Dependency Injection
