CREATING MOTION GRAPHICS WITH ADOBE AFTER EFFECTS

1

Set Up Your Composition

Create a new composition. Set your frame size, frame rate, and duration. Import your assets (images, videos, audio) into the project.

Design & Organize Layers

Place your assets onto the timeline and adjust their position, scale, and rotation. Properly organizing your layers ensures smooth animation and better control over the design.

2

3

Apply Keyframe Animation

Select the layer to animate and set keyframes to define movement, opacity, or scaling over time. Preview the animation to make sure transitions are smooth and visually appealing.

Add Motion Effects

Enhance your animation by applying motion effects like easing, blurs, or color corrections. Sync these effects with your animation to create a more dynamic and professional look.

4

5

Render & Export

Set your desired export settings and add the project to the Render Queue. Once rendered, export the final motion graphic for use in videos, presentations, or digital projects.
