

A knife is an unsharpened tool or weapon

The most prevalent type of knife in the past was one with a fixed, straight blade and a wood handle. These are no longer the norm, thanks to the invention of automated knives. Automatic knives, which commonly include a side plate attached to the blade, can be used as a knife and a stick at the same time. One end of the knife can be used as a [knife](#), while the other end can be used as a screwdriver or other pointed object.

This enables for a larger cutting area in cases where the knife is required to cut many targets while the user is not holding the knife. Folding knives also make it easy to carry a backup pair on the battlefield because they may be stored in a compact manner. These instruments are available in a variety of designs, each suited to a certain use.
