

3 Tips to Increase the Crop Yield

The technology of farming has changed tremendously in the past few decades. Where farmers once relied on nature, now with advancements in the field of agriculture, they can alter some settings to ensure their yield is healthy. There are also ways to increase their crop yield. Let's take a look at some tips on how you can achieve that:

1. Learn from the Past

Look into your past attempts and try to analyse where you went wrong. Use that knowledge to form a better plan to plant seeds this time. In general, it is recommended to do a soil test before planting and plant slightly before the season begins. This will greatly impact the growth of your crops.

2. Know your Seeds

While you may have bought the seeds from a local store or online, do you know the potential of your seeds? Knowing this is important because if you don't know what the potential of your seeds is, you won't be able to properly utilise them. There are various kinds of seeds available in the market for the same plant. You need to know which you have bought and specifically how to look after that plant. Once you know exactly which type of seeds you have and how to look after the plants that grow from them, you will notice a significant change in the health of the plant and the crop yield.

3. Use Plant Growth Promoters

The name is self-explanatory. [Plant growth promoters](#) are one of those things that have seen improvement in these past few years. Although humans have always used growth promoters in the history of farming, in some form or other, the plant growth promoters available now are scientifically tested and organic. This means that if you use them as prescribed, they will play a great role in increasing the crop yield. Since they are organic as well, they will not have any detrimental effect on the health of the plants like fertilisers and insecticides once used to have. However, now even fertilisers and insecticides have been improved in the past few years.

Farming is not an easy task. You need to look after the plant every step of the way and observe its daily growth to ensure it is in the direction as intended. If the plant shows any

infection, immediate steps should be taken for its health. But when it comes to improving the crop yield, now you know 3 tips on how you can achieve that. Use them to have a bumper yield.
