

# Bed Bug Control Brisbane - How to Get Rid of Bed Bugs

Bed Bugs (*Cimex lectularius* and *Cimex hemipterus*) are some of nature's most tenacious survivalists. They are able to withstand long periods of inactivity and tolerate a wide range of temperatures.

With international travel increasing, the blood-sucking bed bugs are on the move. They're hitching rides in travellers' luggage and finding their way into homes. To know more about [Bed Bug Control Brisbane](#), visit the Bug Out Pest Solutions website or call 0426263320.

Bed bugs can invade homes from a variety of sources, including hotel rooms, vacation rentals, and public transportation. In addition to eating animal and human blood, these insects can cause a number of health issues such as insomnia and itchy bites.

These tiny pests can be difficult to detect and treat on your own. They can hide in a wide range of places, such as the seams of mattresses and box springs, behind headboards, and in the cracks of beds and walls. Their small size, light color (upon hatching), aversion to light, and tendency to crawl into crevices make them hard to see.

If you suspect that your home has been infested by these insects, it is a good idea to consult an expert immediately. A professional can perform a thorough inspection and recommend the best course of action to eradicate the infestation.

Bed bugs are the ultimate hitchhikers and have resurged because of global travel. They can infest homes and accommodation facilities, causing stress, anxiety and sleep disturbances for residents. They bite at night, resulting in itchy, red welts on the skin. Infestations can also impact the reputation of properties.

The common bed bug (*Cimex lectularius*) and the tropical bed bug (*Cimex hemipterus*) look similar and both can bite humans and animals. They are oval and rusty brown in colour when fully grown. Adults can also produce a sweet, musty smell when disturbed.

Keep an eye out for rust-coloured spots or drops of blood on bedding, mattresses and upholstered furniture like couches. A light spotting of blood can appear as if it were a spot of dirt or a stain. If you find this, it is a good idea to inspect for a heavy infestation. It is also advisable to minimise clutter to limit hiding places for pests.

There are several treatments for bed bugs but they need to be carried out by a pest control expert as the pests are highly resilient. Chemical and heat treatments are the most effective

methods of eradication. Both methods have their pro's and con's but when carried out by a professional the results are outstanding.

A thorough inspection is the first step in a successful treatment. The pest controller will then provide their thoughts on the best method to eradicate the infestation.

It is important to address an infestation promptly to reduce the chances of re-infestation. This will help you enjoy a good night's sleep and avoid the irritation that these pests cause.

Reputable companies will be transparent about their treatment options and how long they will take to complete the process. This will be influenced by the extent of the infestation as well as any preparation that needs to be completed, adding to the overall treatment time.

Bed bug infestations are on the rise worldwide as people travel more and more. Whether they're hitchhikers picked up at hotels or brought home in second-hand furniture, these critters can quickly become unwelcome guests.

The bites they leave behind are itchy and can lead to unpleasant allergic reactions.

Infestations can spread throughout a property and cause significant disruption to everyday life.

There are a number of preventive measures that can be taken to reduce the risk of an infestation. Regularly inspecting and vacuuming your home is a good start, along with using encasements on your mattress and box springs to trap the bugs and prevent them from escaping. To know more about [Bed Bug Control Brisbane](#), visit the Bug Out Pest Solutions website or call 0426263320.

Heat treatments are also a great way to kill the bugs and eggs without the use of chemicals.

The specialised process creates a sauna-like environment and the temperature is high enough to destroy the bugs and their eggs. Washing infested linens in hot water and drying them on the hottest settings is another effective control method.
