Mean Stack Developers - Aparajayah

Aparajayah works with global Enterprises, SMEs, and forward-thinking Start-Ups as their end-to-end solution partners for custom-tailored software, web, and mobile apps. Through a combination of smart planning, a design thinking approach, and the latest technologies, we help our clients to accelerate their business efficiency. Unlike most of the web development firms in the industry, Aparajayah helps clients develop compelling stores and then bring these stories into the marketplace through exceptional websites.

With programming and web design experience of years, companies hire our web developers for their expertise in PHP, react js, angular js, Java to build CMS, E-commerce, Mean stack & Mern stack and business applications. Our web developers build front-end, back-end, and APIs as per the solution to be created or can engage on dedicated bases to augment your current development team. Aparajayah is a professional Internet Marketing company with High performance-based SEO, SEM, PPC with Latest Techniques gives guaranteed result in google.

MEAN STACK DEVELOPERS :

MEAN (MongoDB, Express.js, AngularJS (or Angular), and Node.js) is a free and open-source JavaScript software stack for generating dynamic web pages and web apps. Because all components of the *MEAN stack developers* allow JavaScript programming, MEAN applications may be written in a single language for both server-side and client-side execution environments.

Despite being commonly compared to other popular web development stacks such as the LAMP stack, the MEAN stack's components are higher-level, including a web application display layer, and do not include an operating system layer.

The acronym *MEAN stack* was created by Valeri Karpov. He initially mentioned the concept in a 2013 blog post, and the logo, designed by Austin Anderson for the original MEAN stack LinkedIn group, combines the first letters of each component of the MEAN acronym.
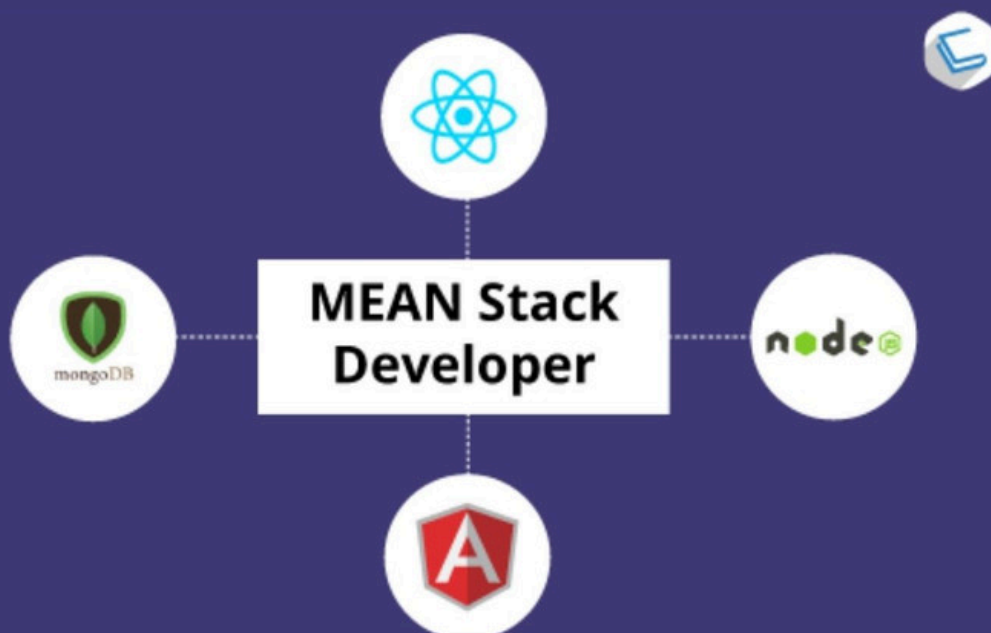

Technologies That Come Under MEAN

MongoDB: It is in handling of web applications' databases.

Express.JS: It's a Node.js framework for creating web application APIs.

Angular.JS: It is a Google-maintained front-end developer framework.

Node.JS: It's in charge of the server-side.
