**Scan to BIM Model** is a process used in the building industry to create digital models of existing designs. The process involves capturing 3D data of a building or site through laser scanning or photogrammetry and then using that data to create a Building Information Model (BIM). This model provides a detailed representation of the building or site, including accurate measurements, materials, and structural elements. If you are looking for reliable and high-quality engineering consulting services, Get In Touch With Us.!
