

How to Get Instant Email Notifications for AWS Lambda Errors with CloudWatch Alarms

When your Node.js Lambda function produces logs, they are stored in CloudWatch Logs. You can then create metric filters in CloudWatch Logs to search for specific log messages based on filters such as INFO, ERROR, or WARN. Once you create the filter, you can attach a [CloudWatch Alarm](#) to it, which can be subscribed to an SNS topic. This way, you'll receive an email notification each time the filter is triggered by a log message.
