# Perform DevOps with test driven development

Looking for a guide on how to perform DevOps with Test Driven Development? Look no further. Read this article to know more.

How to perform DevOps with Test Driven Development?

1 Select a behavior to implement. A behavior can be the desired output or function that you need from your software.

2 Write a test that sees if the behavior is exhibited. The test case must fail at this stage.

3 Add only enough code that passes the test case.

4 Reduce duplicate code wherever present. Clean the code thoroughly.

5 Repeat this entire process till all the features/behaviors are included
