

Global Honeypot Networks -Cyble Resources

Cyble Research and Intelligence Labs analyzes the key role of Honeypots in identifying malware and cyber threats.

What are Honeypots?

In a cybersecurity context, honeypots refer to decoy systems or network resources designed to intentionally attract Threat Actors (TAs) and then deceive them. If they are set up correctly, these honeypots appear to be legitimate targets to most TAs. However, they are actually isolated from any critical networks/data and monitored closely by infosec professionals.
