

# Professional Appliance Repair High-end Maintenance Checklist

**Home Appliance Maintenance Checklist For Your Viking, Sub-Zero, KitchenAid, GE Monogram, and Thermador Appliances**

- Clean Your Appliance Regularly**  
Make it a habit to clean your appliance after use and remove grease, stains, and food particles that could cause mold growth. These could harden and could be hard to remove if left alone.
- Clean The Condenser Coils**  
Usually found at the back of your refrigerators, use a bristle brush to dislodge and remove any dust stuck on the coil. Use a vacuum to gather all the debris and reduce spreading it in your home.
- Avoid Using a Harsh Solution On Your Appliance**  
Harsh chemicals can strip away the protective layer on your appliance. Use mild chemicals to clean your unit or a vinegar solution to remove debris.
- Check Your Appliance For Leaks**  
From electrical wires on your electrical range to gas lines on your oven to water lines for your refrigerator, check your appliances for any leaks and tears that could cause issues to your unit.
- Use A Vinegar Solution**  
A mixture of vinegar and water can dissolve any clogged or hardened junk in your cooktops, ovens, and ranges. Soak the surface with the solution and use a damp cloth to clean it.
- Calibrate the Temperatures**  
You'll need the thermostat of your oven or refrigerator in good condition to measure temperature accurately. Follow your user's manual steps to match your appliance's temperature readings to the thermometer's output.

If you have appliance issues at home, our repair experts can provide the necessary solutions to get your unit working in top condition.
