

How to Control Ants During the Warmer Months

How to Control Ants During the Warmer Months

BLOG

Both inside and outside your home, ants may be a major nuisance. They will keep moving until they find a safe place to hide and some food. Infestations of ants, particularly during the warmer months, may be challenging to eliminate. Ants may wander aimlessly about your home throughout the late spring. They do it in search of food. Also, they walk around, sheltering from the harsh weather. It is common knowledge that ants are among the most problematic pests to eradicate. You would need the best **Ant control service in Kolkata** there. They can squeeze through the tiniest of crevices. They do that in quest of water and sweet, sticky food items left out or dropped.

Like us, they are always looking for sustenance, shelter, and liquid refreshment. You may reduce the possibility that this thief will attempt to make your home their permanent residence. Do that by denying them access to these resources. Because, like people, ants will look in other areas if they don't find what they're after in the first. Here are some things you may do to stop the ant problem before it gets out of hand...

Keep perishables in airtight containers at all times

It's common knowledge. Ants will infiltrate a home's kitchen if they smell food being prepared. Ensure all your food storage areas are secure and out of the way to reduce the risk of this occurring in your home. Food should be stored in cabinets or cupboards. The items should be maintained in sealed containers. The trash should have a lid. The dirty dishes should be included everywhere. The sink should be kept clean. And there should be no crumbs lying around on the floor. Scavenging ants are less likely to re-enter your home if you follow these simple preventative measures. As you hire the **Ant control service in Kolkata**, they will be advising you the same.

Sugar, honey, syrup, and other sticky sweet treats should be tightly wrapped. They should be stored in the fridge at all times. Since ants are attracted to sugar and other precious and sour foods, keeping them locked up is essential. This will assist in avoiding an infestation.

Always use clean water and food dishes for your pet

The pet food you leave on the ground for your pet all day is a prime target for ants since they can quickly get it. You don't want to waste food by leaving it out for your pet all day, right? Then you should only feed them as much as they can consume in one session. Leftovers should be wrapped in a sealed bag so they don't continue to attract ants.

Check the outside of your house thoroughly

It's a good idea to make a brief safety check of your property before the warm weather of summer comes. Inspecting the surroundings for cracks and other entries is essential. It points out that the small black ant army may utilize it to invade the building's interior. You can make the **Ant pest control** services do the needful.

Don't miss your regular trash pickups

The current hot and muggy weather makes it a terrible idea to store any leftover food indoors. It's also a good idea not to leave full trash bags around the house. Otherwise, this can attract ants and make it more challenging to get rid of them.

Ants are attracted to various things in and around our homes. It includes the food we prepare and store in our kitchens. To avoid a variety of pests, it is crucial that you routinely dispose of trash. Otherwise, trash becomes particularly smelly or overcrowded. To keep pests at bay, removing all garbage from your home is advised. However, the trash cans themselves are often overlooked. Not all garbage cans have liners. Even when they do, sometimes the bags or liners break or leak. It allows material that might be smelly, sticky, or rotting to accumulate. There are trash cans without liners since the law does not require doing so. Unsanitary garbage cans like this one are a magnet for ants and other pests. This is why it's essential to clean out garbage cans regularly. Do that especially for the ones that have been used to store food. They also eliminate rotting remnants that might attract pests like ants.

Get rid of the crumbs and wipe up the spillage right away

Ant colonies often begin on the floors and countertops of a house. As a result, it's even more critical to complete a daily sweep of your floors. Do that after finishing activities like cooking, eating, or preparing food. All the countertops should be washed down with soap and water. Any sticky residue should be removed. Take these measures. Then you may rest easy knowing that your home is secure from any potential intruders. You would need the best **Ant pest control** in the area to address this.

Get rid of any potential nesting spots for birds

Check logs, trees with voids where limbs once were, deck pots, and rain gutters. They are all potential nesting spots for ants surrounding your home. Summer is the nesting season for ants because they thrive in dark, damp places. It's common knowledge. Places like this harbor thousands upon thousands of ants. They are a constant supply of ants that find their way into people's houses. Your chances of having any problems this summer may be significantly reduced. For that, you need to survey your yard. You should eliminate these hiding places (or clear them out, in the case of planters and gutters).

Water leaks should be repaired immediately

Like many other pests, ants need humid conditions for survival and reproduction. Therefore, they tend to cluster in areas with high humidity levels and stagnant water. Basements and laundry rooms are just two examples of rooms that might have plumbing issues. They include leaky pipes, broken fixtures, or blocked drains. Standing water not only attracts more bugs, but it may also cause structural damage to your home. Repair dripping pipes and place dehumidifiers in damp areas. They may help reduce the likelihood of an ant infestation.

Seal up any openings that might let pests into your home

Ants can squeeze through openings smaller than human hair. So ants can find their way inside even well-protected homes. It may not be easy to see all of these tiny holes. But sealing more significant gaps and cracks may effectively keep ants out of your home. Check the caulking around the baseboards and the bottom of the doors and windows. Also, keep an eye on the weather stripping and door sweeps. Everything that isn't adequately sealing off your home should be replaced or repaired. It's also a good idea to check the hose faucets, electrical boxes, and dryer vents outside your home. You can check them for cracks or openings that pests may exploit to get access. Unwanted pests often enter a home via them.

Conclusion

Moss, garbage cans kept near the house, open compost collections, and wood piles are all potential outside attractants. These might be present in your yard. Rats and mice find refuge in wood piles. Therefore, it is essential to take the necessary precautions. You need to prevent these pests from entering your home and making it their home. Hiring the **Ant pest control** services can be the best option for you.
