What is Dydrogesterone Tablet IP 10 mg?

Dydrogesterone is a synthetic progestogen, which means it functions similarly to the natural hormone progesterone in the body. Doctors commonly prescribe it in tablet form, with each tablet typically containing 10 mg of the active ingredient.

How Does It Work?

Dydrogesterone works by binding to progesterone receptors in the body, helping to regulate the menstrual cycle, maintain pregnancy, and prepare the endometrium (lining of the uterus) for implantation of a fertilized egg.
