

Does radiation cause hair loss?

Yes, radiation can cause hair loss. The extent and type of hair loss depend on the dose of radiation received, the area of the body being treated, and the individual's sensitivity to radiation. Radiation therapy, which is commonly used to treat cancer, targets rapidly dividing cells, including hair follicles. As a result, hair loss can occur in the area being treated. This can include the scalp, face, or other parts of the body.

The severity of hair loss can vary. In some cases, hair loss may be temporary, and the hair may grow back once the [Radiation Treatment](#) is complete. However, in other cases, hair loss may be permanent, especially if high doses of radiation are used or if the hair follicles are severely damaged.

AWARENESS OF JUNE MONTH

Does Radiation Cause Hair Loss

Dr. Dodul Mondal
ONCOLOGIST
@drdodulmondal

Associate Director
Max Super Specialty Hospital, Saket, New Delhi
Oncology/Radiation Oncology
