

# keratoconus Treatment in Andheri Mumbai | Smart Vision Eye Centre

## **Keratoconus**

Keratoconus is an eye condition in which your cornea (the clear, dome-shaped front of your eye) gets thinner and gradually bulges outward into a cone shape.

A cone-shaped cornea causes blurred vision and may cause sensitivity to light and glare.

Keratoconus usually affects both eyes. Symptoms of keratoconus may change as the disease progresses.

## **Common Symptoms:**

- Blurred or distorted vision
- Increased sensitivity to light
- Frequent changes in prescription glasses or contact lenses
- Difficulty with night vision

## **Diagnosis:**

An eye care professional can diagnose keratoconus through a comprehensive eye exam, corneal mapping, and other specialized tests.

## **Treatment Options:**

### **1- Glasses or Contact Lenses:**

- In the early stages, eyeglasses or soft contact lenses may be sufficient to correct vision.

### **2- Rigid Gas Permeable (RGP) Contact Lenses:**

- RGP lenses can provide better visual acuity by compensating for the corneal irregularities.

### **3- Corneal Cross-Linking (CXL):**

- A minimally invasive procedure that strengthens the cornea using UV light and riboflavin eye drops, aiming to slow or halt progression.

### **4- Intacs:**

- Small, curved devices implanted into the cornea to help reshape it and improve vision.

### **5- Corneal Transplant (Penetrating Keratoplasty or DALK):**

- In advanced cases, a corneal transplant may be recommended to replace the damaged cornea with a healthy donor cornea.
