

Injection Molding Oem

**Wuxi Glory Plastics**

INJECTION MOLDING OEM

Injection Molding refers to the method that a mold is gotten by cooling and solidifying the heated and melted material injected into the cavity via high pressure. The method is suitable for the mass production of parts with complex shape and is one of the important processing methods. The molding process can be broadly divided into the following six stages of "combining mold – injection – packing – cooling – opening mold – product removal ", and once the above process is repeated, products can be continuously produced.

 Black Wheel	 Car Tire Wheel Chock Stop Block Auto Stopper	 Cooling Fan
 Aerosol Cap	 Automotive Hydraulic Clutch Bearing	

The molding process can also be divided into method and die-casting method. The molding machine (referred to as injection machine or injection molding machine) is a main molding equipment making thermoplastic or thermosetting material into plastics of various shapes by using plastics molding mold, while molding is realized through injection machine and mold.

China OEM Plastics are one of the most reputable names in the injection molding industry. They have been around for a long time and have grown to become one of the largest injection moulding service providers in China. Our injection-molding products are used on many types of industrial goods, such as medical devices, hardware and electrical products.
