

gears, bearings, and other breakdown maintenance and preventive maintenance

This is common in gears, bearings, and other [breakdown maintenance and preventive maintenance](#)

rotating equipment. Cracks start at the surface of the part and propagate to the metal due to ignorance of the lubricant management of the equipment. This is caused by stresses on the surface of the part that are greater than those in the metal itself.

To avoid this type of failure, it is important to carefully select components for their application and to lubricate them regularly.
