KORG Wavestate Native v1.3.8 U2B macOS-MORiA

Release Notes

10, Sep 2024 at 08:36

- Ableton Live: program changes are slower than expected for VST3 instruments in general, on both Windows and macOS. The slowness appears to be more noticeable for plug-ins with large numbers of automatable parameters, including wavestate native. On macOS, we suggest using the AU version of wavestate native as a workaround. Ableton is aware of this issue.

- While moving plug-in knobs and sliders in Ableton Live, Live may send the resulting parameter changes back to the plug-in out of order. Previously, this interfered with smooth knob and slider movement. This out-of-order feedback is now ignored.

- A change in FL Studio 24 resulted in a namespace collision, which in turn caused plugins to crash. This has now been fixed.

- When an updated version is detected, the download link now uses https instead of http. The previous use of http caused a security warning to appear in Chrome browsers.
