

Jewellery ERP Software for Manufactures & Distribution

The main activities of any business are production and distribution. Due to the significant volatility and market changes of the jewelry industry, a reliable ERP software system that can manage all of the daily operations is required.

Manual errors are not acceptable because they will significantly lower revenue. The necessity for, advantages of, and features of [jewellery ERP software](#) are discussed in this blog.

Is a Jewelry Erp Software Required?

The main justification for choosing an ERP system is the unique nature of the firm. In contrast to other businesses, the market value of gold is always fluctuating, making quick price updates essential.

It is essential for jewelry companies to buy when prices are low in order to earn long-term profitability. Spreadsheets cannot be used to understand the needs or analyze the demand. Your call to action is now here.

When market prices are low or a payment is due, an ERP system can automate the buying process. [jewellery ERP software](#) can handle both little and large transactions with ease. As a result of improved operational efficiency and viability, your revenue can be doubled.

Why You Should Use Jewelry ERP Software?

- Jewelry Product Development Control
- Client Order Management

- Mobile Apps Connectivity (Integration with Mobile Apps)
- RFID & Mobile Apps Make Controlling Quick & Accurate
- Multi Location, Multi Currency, Multi Stocks, Multi Users
- Advanced MIS

Top 5 Jewellery Software Features

1. Control raw materials and purchasing costs

At the point of sale, commodity purchase costs can be noted, and the system can handle metal fix pricing for precise costing.

2. Waste Handling

The capacity to keep track of prices for base metals and the volume of by-products and scrap generated throughout the manufacturing process. As the system helps in the optimization of current processes to decrease waste at all levels of the business, including raw resources, human capital, and time, manufacturers can adopt the "Lean manufacturing" strategy.

3. Add traceability to batch manufacturing

A distinct identification number is given to every master batch record created in the system, enabling batch manufacturing of particular sizes or styles to be tracked methodically. The ERP system provides complete traceability from the point at which a product is created to the point at which it is sold. The products utilized in manufactured goods may be specifically matched to purchase orders for costing purposes.

4. Electronic Data Exchange via (EDI)

With ERP, you may automatically exchange delivery notes, invoices, and purchase orders. It could improve accuracy and do away with the need for users to enter data again.

5. Controlling Stock

Track important and small items with ease. ERP makes ensuring that stock data is shared around all the departments. The company's online store or sales locations can readily retrieve information about inventory and price. This streamlines stock levels and sales data, making it simple for the company to respond to customer demand.
