Understanding Safe Abortion - MTP:

A medical abortion, also known as a **medical termination of pregnancy (MTP)**, is a non-surgical process using medication to halt a pregnancy. It is most effective during the first trimester and can be performed in a hospital under a doctor's supervision. Dr. Arohi Tasgaonkar specializes in safe abortion procedures to ensure the well-being of her patients.

Types of Abortion:

- Medical Abortion: Involves medication to stop the pregnancy.
- Surgical Abortion: Removal of the pregnancy through a clinic or hospital procedure.

Medical Abortion Process:

A medical abortion typically involves two sets of tablets - Mifepristone to inhibit hormone production supporting pregnancy, followed by Misoprostol to induce contractions for pregnancy expulsion. This method is often preferred for its privacy, convenience, and effectiveness.

Who is Eligible for Medical Abortion:

Medical abortions are suitable for women in their first trimester seeking to terminate an unwanted pregnancy or manage miscarriage. However, certain conditions may make individuals ineligible for this procedure, such as advanced pregnancy stages or specific health issues.

Risks and Considerations:

While medical abortions are generally safe, patients may experience side effects like cramping, bleeding, nausea, and headaches. It's essential to discuss potential risks and outcomes with Dr. Arohi Tasgaonkar before proceeding with the procedure.

Legal Aspects of Abortion in India:

Abortion laws in India vary based on circumstances such as marital status and reasons for termination. It is crucial to understand the legal framework surrounding abortion to make informed decisions.

Post-Abortion Care and Fertility:

After an abortion, it is possible to conceive again relatively soon. However, doctors recommend waiting at least three months to allow the body to heal properly before attempting pregnancy again.
