

An algorithm that maps data to a hash of fixed size is called the hashing algorithm.

## Hashing Algorithm in Java

An algorithm that maps data to a hash of fixed size is called the hashing algorithm. The [hashing algorithm in Java](#) is a cryptographic hash function. A hash algorithm or hash function is designed in such a way that **it behaves like a one-way function**. One way means it is impossible to do the inversion, i.e., retrieving the original value from the hash is impossible. [Read more...](#)
