How to trouble Canon printer

If you are having trouble with your Canon printer to print properly or even any other issues then you make use of the below-given steps to repair your printer. There are many different troubleshooting steps so you can follow on your own to get your printer back in good condition quickly.

Step 1

- Initially, see if your canon printer has its indicator lights in a specific pattern
- And then manual to see if there is an error code
- If any error occurs follow the instructions in the manual for how to fix the issues
- If there is no error continue to the next step

Step 2

- Make sure the power is plugged into your wall and USB cable connected to your computer
- On the top of the printer do a quick visual inspection to see if there is any paper stuck in the paper feed

Step 3

Restart your computer and try to print off in case the computer has stopped recognizing your printer or else the printer has stopped due to the software error

Step 4

- Navigate to your computer control panel
- Click on the Printers and Faxes option

- If your Canon printer is not showing in the list click on the Add a printer button
- And then follow the on-screen instruction so that your computer will try to detect the printer

Step 5

- Uninstall and re-install the Canon software which came with your printer
- And then navigate your Web browser to the official web page
- And then download the recent version of the software driver

Step 6

- Open the canon printer software
- Choose the Properties
- Click on the option to Test alignment or Clean Print Heads which depends on the version of the software you using
- And then wait for few minutes to finish the alignment
- And then off the test page
- Check to see if the test page printer working properly or not

Make use of above-given steps to fix your Canon printer by yourself. If it is not working after that you can contact the [canon printer support](#) to fix your issues.
