1. Change the Oil Regularly

- Just like any engine, your motorhome generator requires regular oil changes to keep it running smoothly.
- Oil lubricates the moving parts inside the generator, preventing excessive wear and overheating.
- Change the oil every 100-150 hours of use or as recommended by the manufacturer.

2. Clean the Air Filter

- A clogged air filter can cause your generator to work harder, leading to overheating or inefficiency.
- Inspect the air filter regularly and clean it when necessary.
- Replace the filter if it's too damaged or worn out.

3. Inspect the Fuel System

- Check for any leaks or cracks in the fuel lines, and ensure that the fuel tank is clean.
- Use fresh fuel and avoid letting fuel sit in the tank for long periods to prevent it from deteriorating.
- If the generator has been unused for a while, run it periodically to keep the fuel system in working order.

4. Test the Generator Regularly

- Start your generator at least once a month to ensure it's working properly.
- Run the generator for about 30 minutes, even when you're not using it, to prevent it from seizing up.

5. Keep It Clean and Well-Ventilated

- Clean the exterior of your generator to remove dirt and debris that can obstruct airflow.
- Ensure the generator is in a well-ventilated area to avoid overheating during operation.

Proper motorhome generator maintenance is crucial to ensuring uninterrupted power during your trips.
