# How Alepo's Data Online Charging System OCS helps operators

## How Alepo's Data Online Charging System OCS helps operators

Alepo's Online Charging System (OCS) is a unified and real-time platform revenue management platform that helps operators readily monetize new services to drive revenue, market share, and customer success. It brings together multiple network types (including LTE, FTTx, WiFi and more) and services such as fixed and mobile data, mobile voice, VoIP SMS, content, VAS services, and video.

The OCS lets service providers introduce pay-as-you-go data plans and on-demand services. It enables real-time credit control and ensures zero revenue leakage.

The standards-compliant solution serves as a 3GPP Online Charging System (OCS) and 3GPP Offline Charging System (OFCS).

The mature and market-proven solution is highly flexible and scalable, can integrate seamlessly in a multi-vendor environment.
