

MySQL Update Join - TAE

The UPDATE JOIN is a MySQL statement used to perform cross-table updates which means we can update one table using another table with the JOIN clause condition.

The UPDATE JOIN is a MySQL statement used to perform cross-table updates which means we can update one table using another table with the JOIN clause condition. The "update join" query modifies and operates join columns. This query can work on single or multiple tables and always requires the SET and WHERE clauses. [Read more...](#)
