# 7 TYPES OF GLASS USED IN HURRICANE WINDOWS AND DOORS

## Dual-Pane Windows

The benefits of having dual-pane hurricane windows are lower energy costs, reduced condensation, diminished noise, and enhanced insulation effectiveness. However, the disadvantage is that it is more expensive.

## Wired Glass

Hurricane windows and doors are extremely heat resistant and can help prevent burglars. On the other hand, the downside here is that exposed broken wire will reveal sharp edges, which can lead to injury. Further, a wire blocks vision and can rust if exposed to prolonged periods of dampness and rain.

## Low E Glass

The best thing about windows with Low E Glass is that they can lower energy consumption. It also applies to double- and laminated-glazing glass and can improve insulating power. However, in some lights or angles, the image may appear blurry.

## Reflective Glass

Reflective glass, commonly referred to as mirrored glass, creates a mirror effect. It can be used for furniture and tabletops as well as a mirror. Further, mirrored glass reflects light, making it ideal for tiny spaces to give the appearance of more room. It may be tailored to fit your design ideas by being cut in several lengths, shapes, and styles.

## Frosted Glass

Frosted glass is frequently utilized to improve bathroom spaces in both residential and business settings. They are available in several patterns, and they may be utilized to increase the amount of privacy and natural light in the space.

## Tinted Glass

Blue, green, and grey tinted glass are the most prevalent colors. Tinted glass is the perfect choice for sunny outdoor settings since it lessens the intensity of glare and heat from the sun. It can reduce the fading of furniture caused by strong UV light, increase daytime privacy, and reduce heat and glare. The downside of this type of glass is that it cuts back on visible light.
