How to insert data using wpdb - php?

how to insert data into wordpress database?

Using the

`$wpdb->insert()`

WordPress has another way of inserting into the database. This is not your usual using of

`INSERT INTO`

 statement.
The basic syntax for inserting data to WordPress database is

`<?php $wpdb->insert($table_name, $data); ?>`

. The

`$table_name`

 is a string that is the name of the database table to insert data into. On the other hand,

`$data`

 is an array that will be inserted into the database table.
Now we have learned the basic syntax for the WordPress insert, we should have a code like this:

1. function myFunction() {
2. global $wpdb;
3. $table_name = $wpdb->prefix . 'my_table';
4.
5. $wpdb->insert($table_name, array('column_1' => $data_1, 'column_2' => $data_2, //other columns and data (if available) ...));
6. }
